Vibration damper EluFlex 10-50 kg ZDMF

Load range axial 10 ... 50kg,

These can be attached to the floor through 2 screw holes.

The vibration dampers are screwed under the cabinets and isolate vibrations and shocks. They offer excellent isolation grades due to low natural frequencies and are very resistant to environmental influences.

Height: 45mm

Mounting: M6

PRINCIPLE:

two springs working against each other are integrated in the bearing in a breakaway manner

force application is symmetrical between both springs, so that besides compression also real tensile loads can be absorbed and progressively damped symmetrical force - path progression in compression and tensile direction progressive (soft) stops in all spatial directions

USE:

efficient and breakaway vibration isolation and shock absorption of aggregates subjected to static and dynamic tensile, compressive and shear loads standing, suspended and wall mountings

PROPERTIES:

robust with long life, maintenance free very corrosion resistant:

highly efficient vibration and shock isolation with elastic puncture protection

MATERIALS

Metals: aluminum alloy, anodized in color

Elastomer: NR (natural rubber)
